5.2 Cognitively Expansive	4	46	9.2 Cognitively Capricious	1	7
5.3 Interpersonally Exploitive	0	0	9.3 Uncertain Self-Image	0	0

For each of the Personality Patterns scales (the scale names shown in **bold**), scores on the three facet scales are shown beneath the scale name.

CONFIDENTIAL INFORMATION FOR PROFESSIONAL USE ONLY

The MACI scales have been normed on adolescent patients who were seen in professional treatment settings for emotional and/or social problems. Scores for nonclinical respondents who have inappropriately taken the MACI test for essentially self-exploratory purposes may be misleading. This report must be viewed as only one aspect of a thorough diagnostic study. The clinician should keep in mind the provisional nature of all assessments of adolescents in light of the attitude change and emotional growth that typifies this developmental period. This report should not be shown to patients or their relatives.

INTERPRETIVE CONSIDERATIONS

In addition to the preceding considerations, the profile report should be evaluated in light of the following demographic and situational factors. This 14-year-old male is currently in the ninth grade. In the demographic portion of the test, he identifies "restless/bored" as the problem that is troubling him the most. A tendency toward avoiding self-disclosure is evident in this adolescent's response style. This nondisclosure may signify a characterological evasiveness or an unwillingness to divulge matters of a personal nature, problematic or not. Also possible are broad deficits in introspectiveness and psychological-mindedness, owing to either emotional impoverishment or thought vagueness. Adjustments made to compensate for these response tendencies are likely to be successful in producing a valid profile; however, some scores may have slipped beneath the effective discriminatory range.

The BR scores reported for this adolescent have been modified to account for the low raw X (Disclosure) scale score, which reflects low self-revealing inclinations, the self-enhancing response tendencies shown by the extreme elevation of Scale Y (Desirability) over Scale Z (Debasement), and the denial tendencies of this adolescent shown by the prominence of Personality Patterns Scale 7 (Conforming).

End of Report

NOTE: This and previous pages of this report contain trade secrets and are not to be released in response to requests under HIPAA (or any other data disclosure law that exempts trade secret information from release). Further, release in response to litigation discovery demands should be made only in accordance with your profession's ethical guidelines and under an appropriate protective order.
